

# Structural steel

## We guarantee the quality of our structural steel

All mild steel members used in our products are hot-dip galvanised after fabrication, and can be powder coated or twopack painted to your preferred colour.

We take every precaution during manufacture and installation and you can expect Landmark structures to retain their good appearance and provide many years of useful service with a regime of periodic inspection and prompt treatment for damage or deterioration.

Powder coated, hot-dip galvanised steel is considered an unsuitable finish for coastal environments.

In corrosive environments we strongly recommend the use of timber or aluminium components and stainless steel hardware for our products

All hot-dip galvanised steel surfaces should be finished with a high quality two-pack epoxy paint system as minimum, and subjected to a rigorous maintenance schedule.

Failure to implement these requirements in marine environments will void the Landmark Products Ltd Structural Integrity Warranty.
